

Lesson 5: Writing and Solving Linear Equations

Classwork

Example 1

One angle is five less than three times the size of another angle. Together they have a sum of 143° . What are the sizes of each angle?

Example 2

Given a right triangle, find the size of the angles if one angle is ten more than four times the other angle and the third angle is the right angle.

4. One angle measures nine more than six times a number. A sequence of rigid motions maps the angle onto another angle that is described as being thirty less than nine times the number. What is the measure of the angles?
5. A right triangle is described as having an angle of size “six less than negative two times a number,” another angle that is “three less than negative one-fourth the number”, and a right angle. What are the measures of the angles?
6. One angle is one less than six times the size of another. The two angles are complementary angles. Find the size of each angle.

Problem Set

For each of the following problems, write an equation and solve.

1. The measure of one angle is thirteen less than five times the measure of another angle. The sum of the measures of the two angles is 140° . Determine the measures of each of the angles.
2. An angle measures seventeen more than three times a number. Its supplement is three more than seven times the number. What is the measure of each angle?
3. The angles of a triangle are described as follows: $\angle A$ is the largest angle, its measure is twice the measure of $\angle B$. The measure of $\angle C$ is 2 less than half the measure of $\angle B$. Find the measures of the three angles.
4. A pair of corresponding angles are described as follows: the measure of one angle is five less than seven times a number and the measure of the other angle is eight more than seven times the number. Are the angles congruent? Why or why not?
5. The measure of one angle is eleven more than four times a number. Another angle is twice the first angle's measure. The sum of the measures of the angles is 195° . What is the measure of each angle?
6. Three angles are described as follows: $\angle B$ is half the size of $\angle A$. The measure of $\angle C$ is equal to one less than 2 times the measure of $\angle B$. The sum of $\angle A$ and $\angle B$ is 114. Can the three angles form a triangle? Why or why not?
